Prima di alimentare il serbatoio assicurarsi che i cavi delle coclea e del sensore livello pellet siano collegati correttamente.  
 Quando verrà alimentata la centralina se il sensore livello pellet è scoperto dopo 5 sec. partirà il caricamento del serbatoio fino al raggiungimento del sensore.  
 Se il sensore non verrà coperto entro il tempo stabilito la centralina andrà in allarme con un segnale acustico (3 bip ogni 30 sec.). Per resettare l'allarme basterà togliere l'alimentazione e rialimentare il serbatoio e il sistema ripartirà nuovamente.

Avant d'alimenter le réservoir, assurez-vous que les câbles de la vis sans fin et du capteur de niveau de granulés sont correctement connectés.  
 Quand l'unité de contrôle sera alimentée si le capteur de niveau de pellets est découvert après 5 s. le réservoir commencera à se charger jusqu'à ce que le capteur soit atteint.  
 Si le capteur n'est pas couvert dans le temps défini, la centrale se mettra en alarme avec un signal sonore (3 bips chaque 30 secondes). Pour réinitialiser l'alarme, il suffit de couper l'alimentation et de remettre sous tension le réservoir et le système redémarrera à nouveau.
